In addition, the user's home directory will be preserved when the share is unlinked and created again. The dialog box available when a share is removed provided users with options to delete their home directories and all shared files and folders. After the option to delete the user's home directory and shared items was selected, this could not be reverted.

There are several other issues that have been fixed in this release:

The following bugs were fixed in the 2015. 4 release. Windows Server 2003 is no longer supported. Certain Clients were unable to establish a network connection if they did not have a domain suffix in their computer name and were not able to contact the Domain Controller. The Clients displayed the following error: "Error: Failed to resolve hostname.com."

Delphi managed to pull data from five different data sources at once while monitoring user activity, instead of limiting itself to one data source. This resulted in all other data sources being unavailable for monitoring, even though these other data sources were available and utilized normally outside of this specific application. When DELPHI upgraded the data source, it did not properly update the column order of the table. This caused inconsistencies in reports delivered to Clients. Delphi also did not correctly reflect the correct fields when viewing the Directory Information Tree (DIT) for an OU, or when adding an OU to a group policy object (GPO).

The following bugs were fixed in the 2015. 3 release: Users with limited administrative privileges could create new GPOs, but were unable to assign them to any users or computers. It was not possible to back up System State Data using Backup Exec Agent for Windows Servers even though it was selected in Backup Exec Admin Console under Backup Options/System State Data/Backup.
